

## **2<sup>nd</sup> year Microbiology 2005 – Summary of student responses**

### **MIC21IM**

Overall, the students continued to be well satisfied with the subject. Especially the practical classes have been very well received and many students indicated how much they have enjoyed the “hands on” work. Comments were especially positive with regard to the demonstrators.

### **MIC22MM**

It was again the practical classes that have been enjoyed a lot but the students also judged most of the topics covered in the lectures to be very interesting. In the Microbial Genetics section new and improved handouts have been provided in order to help those students that have not been taught any Genetics in their previous training. In addition, more time has been spent at the start of the Microbial Genetics section to provide students with the essential background knowledge that will help them in their understanding. At the end of semester, some students pointed out that the surveys are conducted too frequently for each unit, which probably explains why the total number of surveys returned was much lower compared to previous years.
