

2nd year Microbiology 2006 – Summary of student responses

MIC21IM

The unit continues to be very popular with the majority of the students being well satisfied with the lecture material and the teaching overall. It is again the practical classes that have been very well received and many students indicated how much they have enjoyed the “hands on” work. The students also commented very positively on the help and support they received from their demonstrators.

MIC22MM

It was again the practical classes that have been enjoyed a lot but the students also judged most of the topics covered in the lectures to be very interesting. This year a number of Health Sciences students continued to have difficulties in seeing and understanding the relevance of the lecture material to their course. As a result we will emphasise even more at the start of the semester how important it is for anyone who wants to work in the health and medical sector to get a sound understanding in Microbiology. For those students who have difficulties in understanding Microbial Genetics we will introduce a number of tutorials to provide the students with the essential background knowledge.
