In the following illustrations, the scats are grouped according to their shape and size.

What to do when you find a scat

Step 1 Decide the shape of the scat: is it cylindrical; or is it a pellet, or one of a group of pellets, of oval, round or squarish shape? (Some species produce scats that are of mixed shapes, such as oval and cylindrical, so that they are not easy to classify. As a result, there is some overlap in the Key.)

Step 2 Measure the size of the scat: use the approximate width of the pellets or cylinder. If you have several scats, take the average of their widths.

Introduced Animals

- Eastern Grey Kangaroo
- Echidna
- Sheep
- Rabbit
- Hare
- Red Fox
- Cat
- Wombat
- Wallaby
- Dog
